## ADSI16 for WS position sensors

- Resolution 16 bit, data transmission synchronous serial/SSI
- Optional available with 12 bit (ADSI) or 14 bit (ADSI14) resolution
- No loss of data at power-down
- Easy to connect to PLC's with SSI input circuit

### Description

The sensing device of the ADSI is a precision potentiometer. The position information is given by an analog/digital converter output serialized as a data word. Data transmission takes place by means of the signals CLOCK and DATA. The processing unit (PLC, Micro-computer) sends pulse sequences which clock the data transmission with the required transfer rate. With the first falling edge of a pulse sequence the position of the sensor is recorded and stored. The following rising edges control the bit-by-bit A/D conversion, encoding and output of the data word. After a delay time the next new position information will be transmitted.

### Data Format (Train of 26 Pulses)

### Signal Conditioner ADSI A/D converted synchronous serial

Output	EIA RS-422, RS-485, short-circuit proof
Excitation voltage	11 ... 27 VDC

### Recommended Processing Input Circuit

### Transmission rate

Cable length	Baud rate
< 50 m	< 300 kHz
