

Output Capacitor-Less, Low Power Consumption, High Speed LDO Regulator

GENERAL DESCRIPTION

The XC6501 series is a 6.0V high speed, low noise CMOS LDO regulator that can provide stable output voltages within a range of 1.2V to 5.0V (0.05V increments) even without a load capacitor C_L . This is possible because phase compensation is carried out internally unlike other LDOs where it is done externally. The series consists of a reference voltage source, driver transistor, error amplifier, current limit circuit, and phase compensation circuit.

The CE function enables the circuit to be put into stand-by mode by inputting a low level signal to the CE pin thereby reducing current consumption from an already low 13 μ A (in operation) to less than 0.1 μ A. In the stand-by mode, if a C_L cap is used, the electric charge stored at C_L can be discharged via the internal auto-discharge switch and as a result, the V_{OUT} pin quickly returns to the V_{SS} level.

The current limit fold-back circuit operates as a short circuit protection and a current limiter function for the output pin.

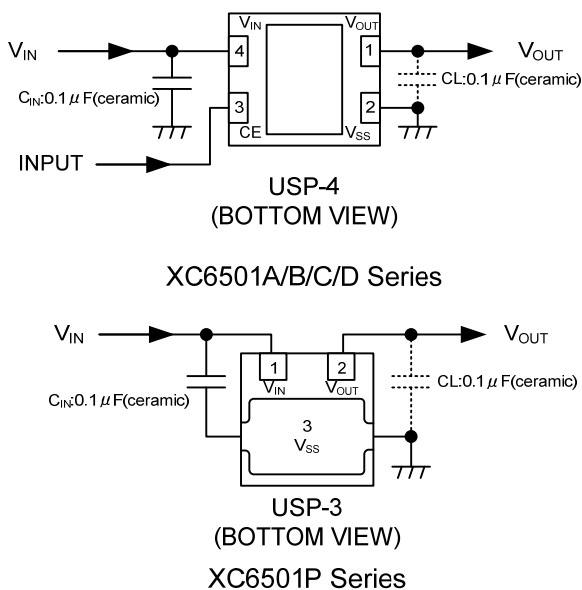

APPLICATIONS

- Mobile phones (RF, Digital cash, I/O etc.)
- Portable games
- Camera modules
- Wireless LAN modules
- LCD modules
- Bluetooth
- Digital-TV tuners

FEATURES

Operating Voltage Range	: 1.4~6.0V
Output Voltage Range	: 2.0~5.0V (Accuracy: $\pm 1\%$) 1.2~1.95V (Accuracy: $\pm 0.02V$)
Dropout Voltage	: 150mV@ $I_{OUT}=100mA$, $V_{OUT}=2.8V$
Low Power Supply	: 13 μ A@ $V_{OUT}=2.8V$
Stand-by Current	: Less than 0.1 μ A
Ripple Rejection	: 50dB@f=1kHz, $V_{OUT}=2.8V$
Protection Circuits	: Current limit (300mA, TYP.) : Short circuit protection
Output capacitor is not required	: Internal phase compensation
CL High Speed Auto Discharge	
Packages	USP-3, USP-4 SSOT-24, SOT-25

TYPICAL APPLICATION CIRCUIT

TYPICAL PERFORMANCE CHARACTERISTICS

XC6501 Series

PIN CONFIGURATION

*The heat dissipation pad of the USP-4 package is recommended to solder as the recommended mount pattern and metal mask pattern for mounting strength. The mount pattern should be electrically opened or connected to the V_{SS} (No.2) pin.

PIN ASSIGNMENT

PIN NUMBER				PIN NAME	FUNCTION
USP-3	USP-4	SSOT-24	SOT-25		
1	4	4	1	V_{IN}	Power Supply
2	1	3	5	V_{OUT}	Output
3	2	2	2	V_{SS}	Ground
-	3	1	3	CE	ON/OFF Control
-	-	-	4	NC	No Connection

OPERATIONAL EXPLANATION

The voltage divided by resistors R1 & R2 is compared with the internal reference voltage by the error amplifier. The P-channel MOSFET which is connected to the V_{OUT} pin is then driven by the subsequent output signal. The output voltage at the V_{OUT} pin is controlled & stabilized by a system of negative feedback. The current limit circuit and short protect circuit operate in relation to the level of output current. Further, the IC's internal circuitry can be shutdown via the CE pin's signal.

XC6501B Series

<C_L High Speed Auto-Discharge Function>

The XC6501B/D series can discharge the electric charge in the output capacitor C_L, when a low signal to the CE pin, which enables a whole IC circuit turn off, is inputted via the N-channel transistor located between the V_{OUT} pin and the V_{SS} pin as shown in the BLOCK DIAGRAM. The C_L auto-discharge resistance value is set at 400 Ω (V_{OUT}=5.0V @ V_{IN}=6.0V at typical). The discharge time of the output capacitor C_L is set by the C_L auto-discharge resistance R and the output capacitor C_L. By setting time constant of a C_L auto-discharge resistance value Rdischg and an output capacitor value C_L as τ (τ = C x Rdischg), the output voltage after discharge via the N-channel transistor is calculated by the following formulas.

$$V = V_{OUT(E)} \times e^{-t/\tau}, \text{ or } t = \tau \times \ln(V_{OUT(E)} / V)$$

where V : Output voltage after discharge, V_{OUT(E)} : Output voltage, t : Discharge time,

τ : C_L auto-discharge resistance Rdischg x Output capacitor C_L

<Current Limiter, Short-Circuit Protection>

The XC6501 series' fold-back circuit operates as an output current limiter and a short protection of the output pin. When the load current reaches the current limit level, the fixed current limiter circuit operates and output voltage drops. When the output voltage is shorted to the V_{SS}, its current flow reached and minimized to about 25mA.

<CE Pin>

The IC's internal circuitry can be shutdown via the signal from the CE pin with the XC6501 series. In shutdown mode output at the V_{OUT} pin will be pulled down to the V_{SS} level via R1 & R2. However, as for the XC6501B/D series, the C_L auto-discharge resistor is connected in parallel to R1 and R2 while the power supply is applied to the V_{IN} pin. Therefore, time until the V_{OUT} pin reaches the V_{SS} level becomes short. The output voltage becomes unstable, when the CE pin is open. If this IC is used with the correct output voltage for the CE pin, the logic is fixed and the IC will operate normally. However, supply current may increase as a result of through current in the IC's internal circuitry when medium voltage is input.

NOTES ON USE

1. Please use this IC within the stated absolute maximum ratings. The IC is liable to malfunction should the ratings be exceeded.
2. This IC achieves stable operation without an output capacitor C_L by internal phase compensation. However, wiring impedance is high, operations may become unstable due to noise and/or phase lag depending on output current. Please wire the input capacitor C_{IN} and the output capacitor C_L as close to the IC as possible.
